

## SynSisal® Rug Placement

### Rug Placement

Unroll your SynSisal Rug and allow it to acclimatise for 24 – 48 hours after arrival to help settle any curling of the edges before placing furniture on top.

If edges are still curling after the required acclimatisation period, back-rolling the edges in the opposite direction of the curling will speed up the settling process.

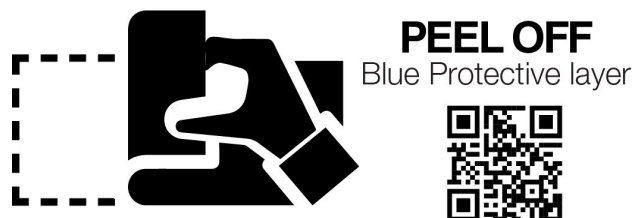

If curling is still apparent and/or you have concerns, please contact us at [rugs@gibbongroup.com.au](mailto:rugs@gibbongroup.com.au).

### Non-Slip Backing or Gripper Tape

Rugs with Infinity edge will come standard with an anti-slip pattern on the felt pad. Rugs with a serged edge or wide binding will have standard felt backing and without an anti-slip option.

Smaller rugs (under 6 square metres in size) will come with anti-slip tape.

The **anti-slip tape** is applied to the underside of smaller rugs on the edges running with the rib direction. **Remove the blue protective layer**, and press down or walk on the surface to get the best possible bond.

### Rotation & Maintenance

Rotating your rug often will allow the normal wear to be more evenly distributed and will also help to minimise colour changes that may occur from exposure to direct sunlight.

Attention to ongoing maintenance (vacuuming) will help prevent potential for premature wear from dirt & marks (see **Care & Maintenance guide** for further details).
